

# They may be listening, but do they hear you?

## Be heard clearly no matter what

Due to common classroom noise and the natural drop-off of a teacher's voice, many students at the back of the class were already missing out on important parts of their lessons. Communicating through PPE and social distancing have compounded the issue and students

are unable to stay focused on what they cannot hear. This has an obvious effect on student engagement and ultimately student success. Many schools are turning to Classroom Audio Distribution Systems (CADS) like the FrontRow Juno to ensure intelligibility for their students and to save their teacher's voices.

## Can your students understand you?

Research has shown that students routinely miss up to 25% of what their teacher is saying. Lip reading can often supplement speech understanding, by using prior knowledge to fill in the gaps of the message being communicated. With a mask, students miss out on these context clues, making it harder to learn. Amplifying the teachers voice can help overcome this very visible barrier to learning.

## Crystal clear lessons for both in-class and remote students

Many school boards/districts across the country have introduced a new hybrid model of learning for students in their schools. This model blends face-to-face learners with virtual learners in the same class.

FrontRow's Juno, the proven industry standard all-in-one classroom audio solution provides superior, intelligible sound to both in-class and remote students. This

turnkey, budget-friendly technology can be setup in minutes and integrates with popular video conferencing systems such as Zoom, Microsoft Teams, Skype, and Google Meet seamlessly!
